Simiskina pharyge deolina

Male Upperside

Male Underside

Fruhstorfer 1917 - The Blue-line Brilliant

So far, this species has only been found, locally, on Koh Pha Ngan.

A very rare species found at the edges of woodland, though not generally in the forests, themselves.

The male upperside has brilliant metallic blue patches on both wings, but the female is totally brown on the upperside. The species can be identified as being the only member of the genus that has metallic blue markings on the tornal area of the underside hindwing.

Flight Period

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
									x		

Wingspan

25 - 30mm

Early Stages

Not known

Larval Foodplant

Not known

Range

Southern Myanmar, Peninsular Thailand, Malaysia, Sumatra and Borneo.
